Job Application Data Analysis Project

1. Project Overview

This project focuses on analyzing job application data using Python and Pandas. The dataset includes details such as company names, job roles, locations, application platforms, application dates, status, and salary offers. The goal is to extract meaningful insights that help track job application performance and improve job search strategies.

2. Tools & Technologies Used

- Python
- Pandas (Data Analysis)
- Jupyter Notebook / VS Code
- Git & GitHub

3. Dataset Description

The dataset contains the following columns:
- Company
- Role
- Location
- Platform (LinkedIn, Naukri, Referral)
- Date Applied
- Status (Applied, Interview, Rejected)
- Salary Offered

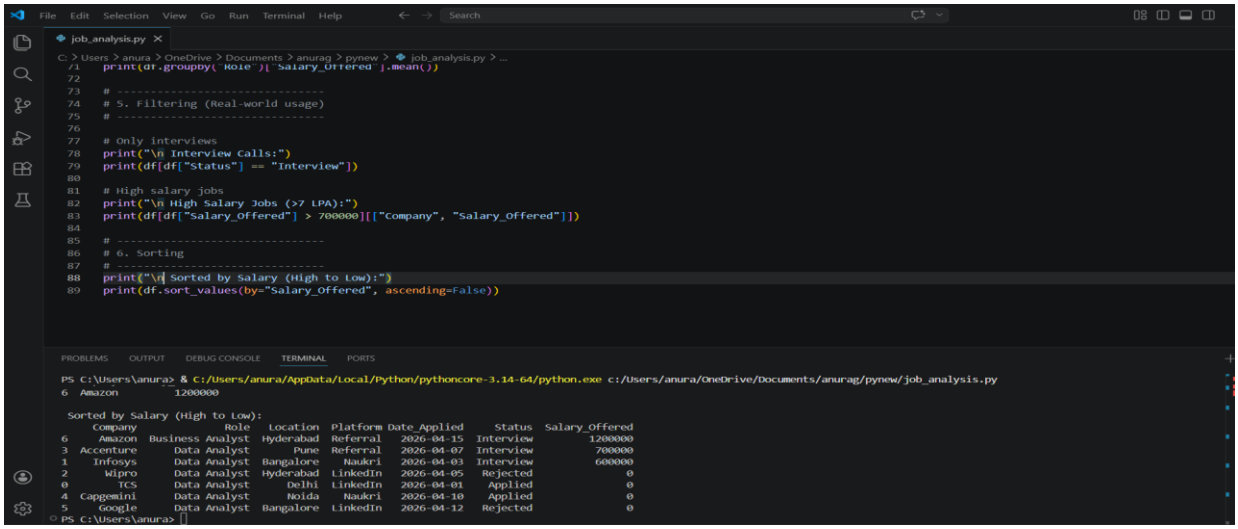
4. Work Performed

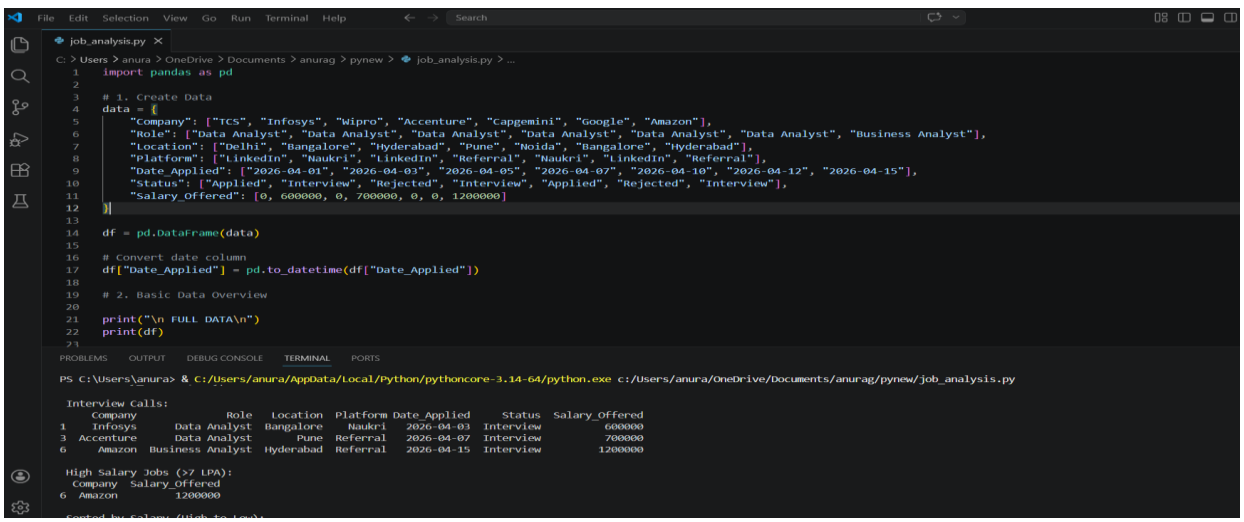
The following steps were performed in this project:
- Created a structured dataset using Python dictionary
- Converted date column into datetime format
- Performed exploratory data analysis (EDA)
- Calculated key metrics such as total applications and interview rate
- Used grouping and aggregation for insights
- Filtered high-value job opportunities
- Sorted data based on salary

5. Key Insights

- Total Applications: 7
- Interview Rate: ~57%

- Highest Salary Offer: ₹12 LPA
- Most Effective Platforms: LinkedIn and Referral
- Cities with More Opportunities: Bangalore and Hyderabad





6. Outcomes & Learnings

This project helped in understanding how data analysis can be applied to real-life scenarios like job tracking. It improved skills in data manipulation, filtering, grouping, and extracting insights using Pandas. It also demonstrated how data-driven decisions can improve job search efficiency.

7. Conclusion

This project showcases practical data analysis skills and can be extended into dashboards using tools like Power BI or Streamlit for better visualization and interactivity.
